Digitizing Processes
Transitioning the Safety Huddle Template from Paper to Electronic

Akhil Plathanathu BHS; Amanpreet Ghuman RN, BScN, MScN; Jennifer Yoon RN, BScN, MSc (QI/PS), PhD Student

Description
Safety huddles play a critical role in ensuring that discussions around patient safety and quality of care concerns are occurring. At Humber River Hospital (HRH), clinical areas conduct safety huddles as part of their daily practice. Traditionally, a paper template was used to facilitate safety huddle discussions. Information from completed templates were then manually transcribed into an electronic document to be stored for future reference. Being a digital organization, HRH prioritizes the digitization of existing processes. As a result, HRH designed an electronic safety huddle template. Replacing the paper version, this new template allows data to be entered and stored electronically in real-time during safety huddles.

Actions Taken
- Utilized digital platforms to transform the paper safety huddle template to an electronic format.
- Pilot tested on inpatient units to determine effectiveness and incorporation into workflows.
- Conducted surveys with end-users to evaluate their experiences and identify areas for improvement.

Summary of Results
The initial pilot of the electronic safety huddle template was well received, with staff consistently completing the new template. 66% of staff responded positively to the use of the new electronic template, citing that this streamlined process eliminated the need to manage paper records. This also meant a reduction in human resources, as additional staff were no longer needed to transcribe huddle data. Continuous collection of end-user feedback supports an iterative improvement process for the electronic safety huddle template.

Lessons Learned
To ensure the successful incorporation of new practices, sufficient pilot testing and surveying end-users for feedback is necessary in the digitizing of traditional processes to streamline workflows.
